

Designer, Programmer, Writer

I'm a programmer and designer from Germany. My main focus is web development and design but I also have experience in cybersecurity and I'm a fiction writer. Currently I'm studying at the Technical University of Applied Sciences in Augsburg.

DEVOTEE

A social media platform for content creators and content monetization we've been developing over the course of 3 years.

DEVOTEE

DEVOTEE is a platform for managing digital and physical content created by our creators.

It allows creators to upload their content and monetize it in a few different ways.

We offer a subscription model, a pay-per-view model, and a tipping model, depending on the specific situation.

In return for providing a secure and anonymous space for these kinds of transactions, we take a small fee of 15% on each transaction through our platform.

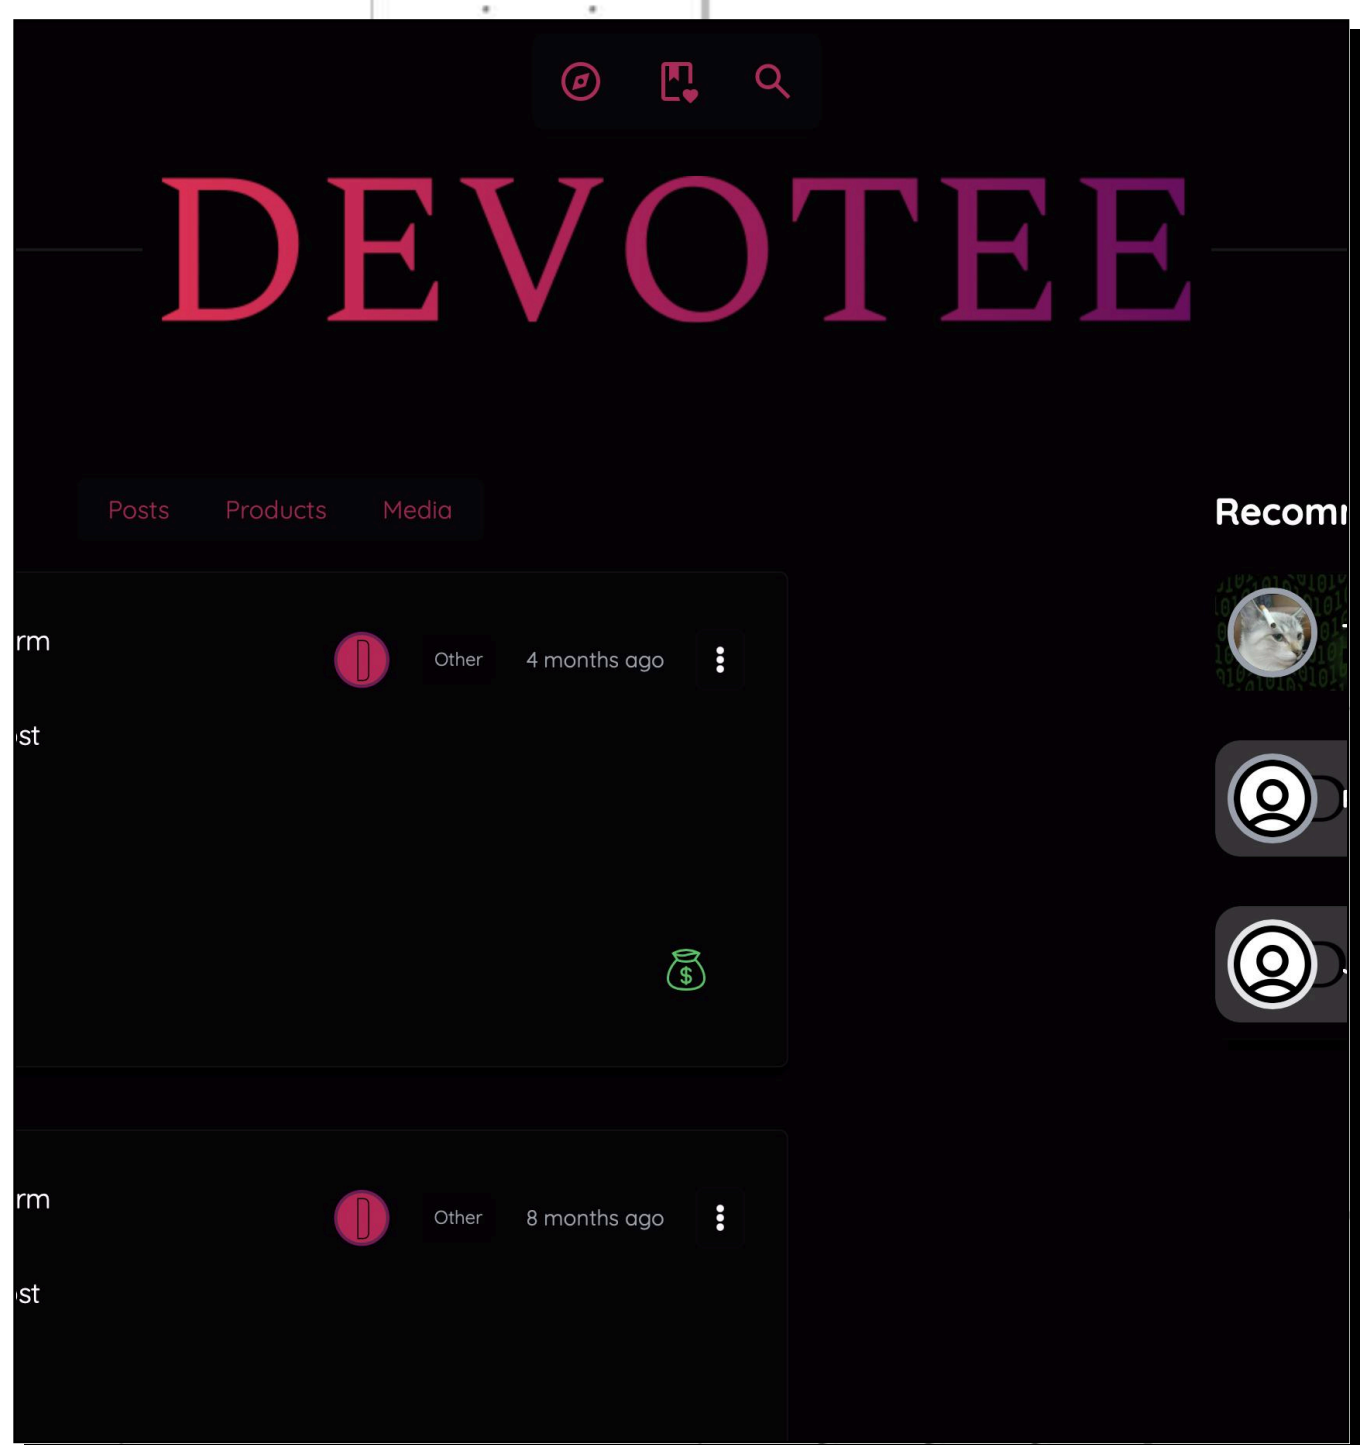

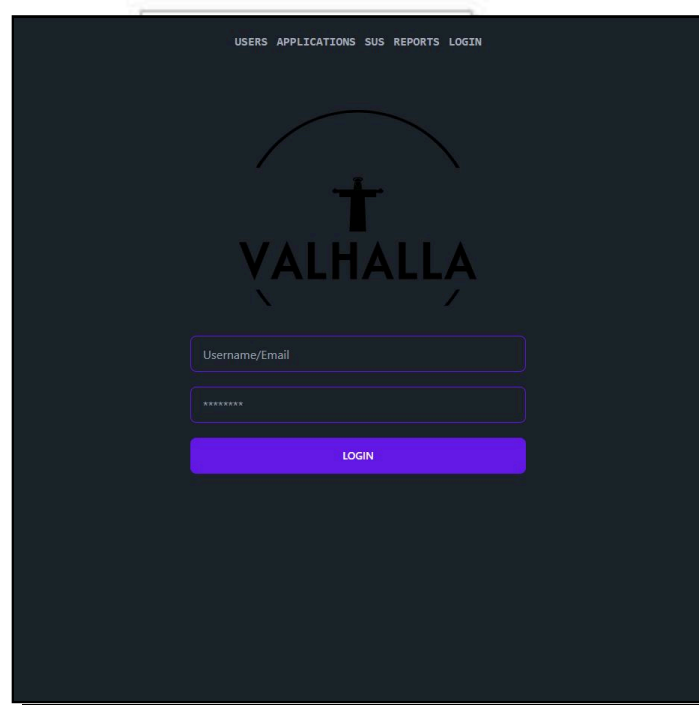

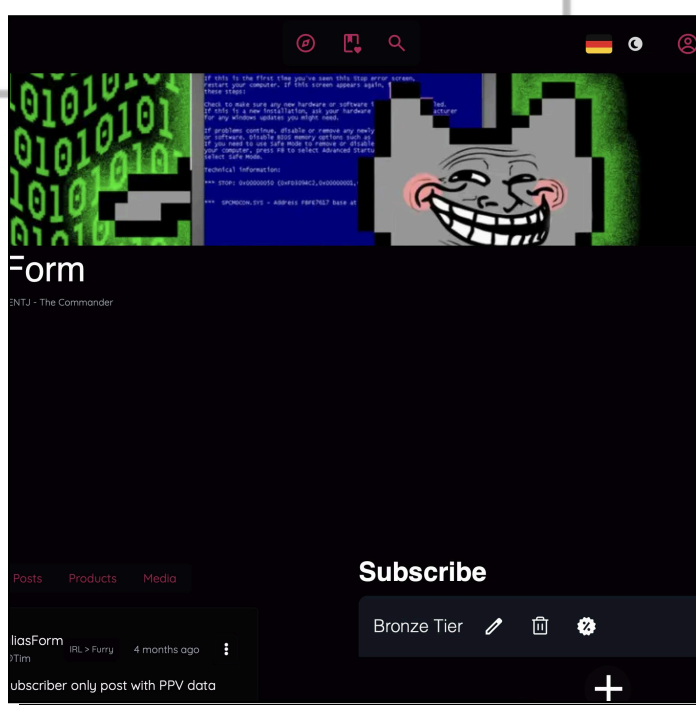

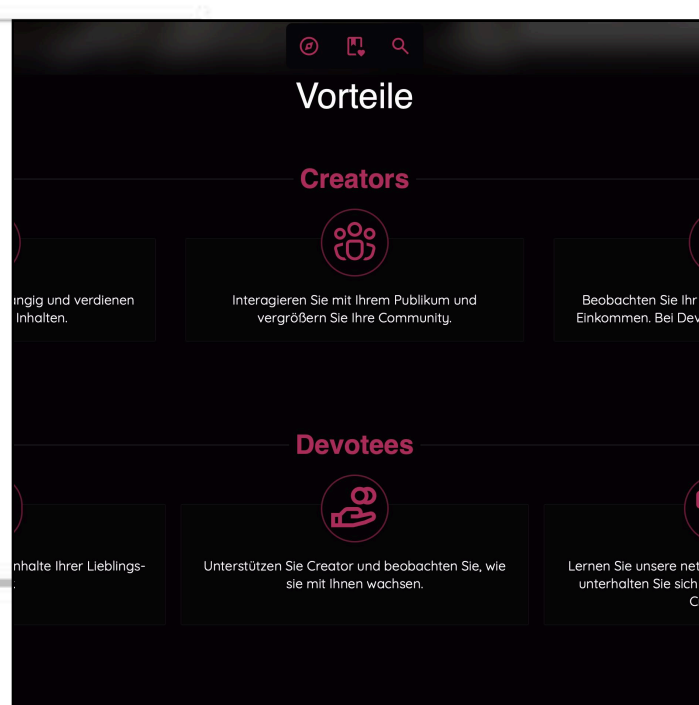

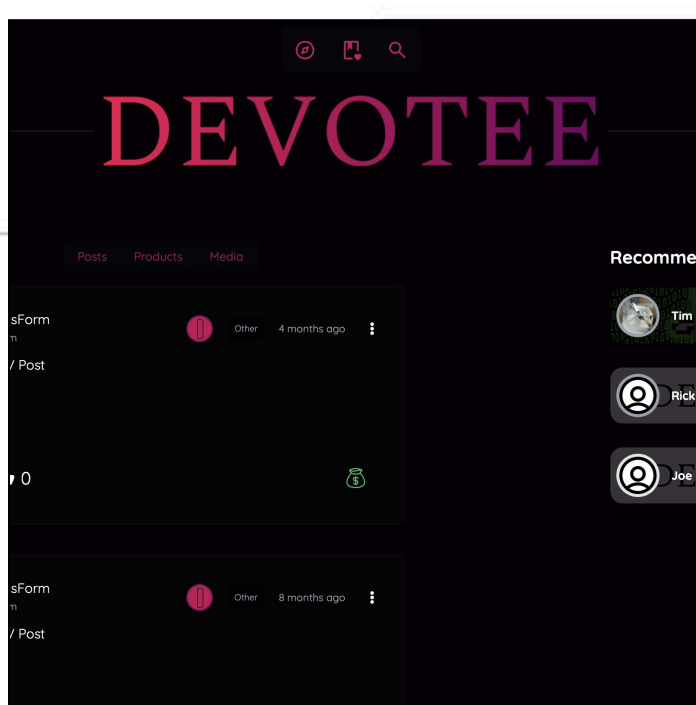

Welcome to DEVOTEE

Create. Monetize. Profit.

The next generation of content creation.

Don't miss our launch soon!

DEVOTEE waitlist page for signing up to receive updates about the development.

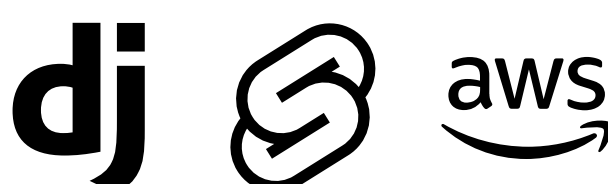

DEVOTEE has been an enormous group effort.

My partner developed certain parts of the frontend (login & profile pages) and I mainly worked on the other parts of the frontend, the backend and our own admin panel "Valhalla".

The backend consists of multiple different parts that work separated from one another, primarily the "main" part handling basic logic and database actions and the "worker" part that handles media conversion to save storage space on our S3 bucket.

Technologies

TipTalk

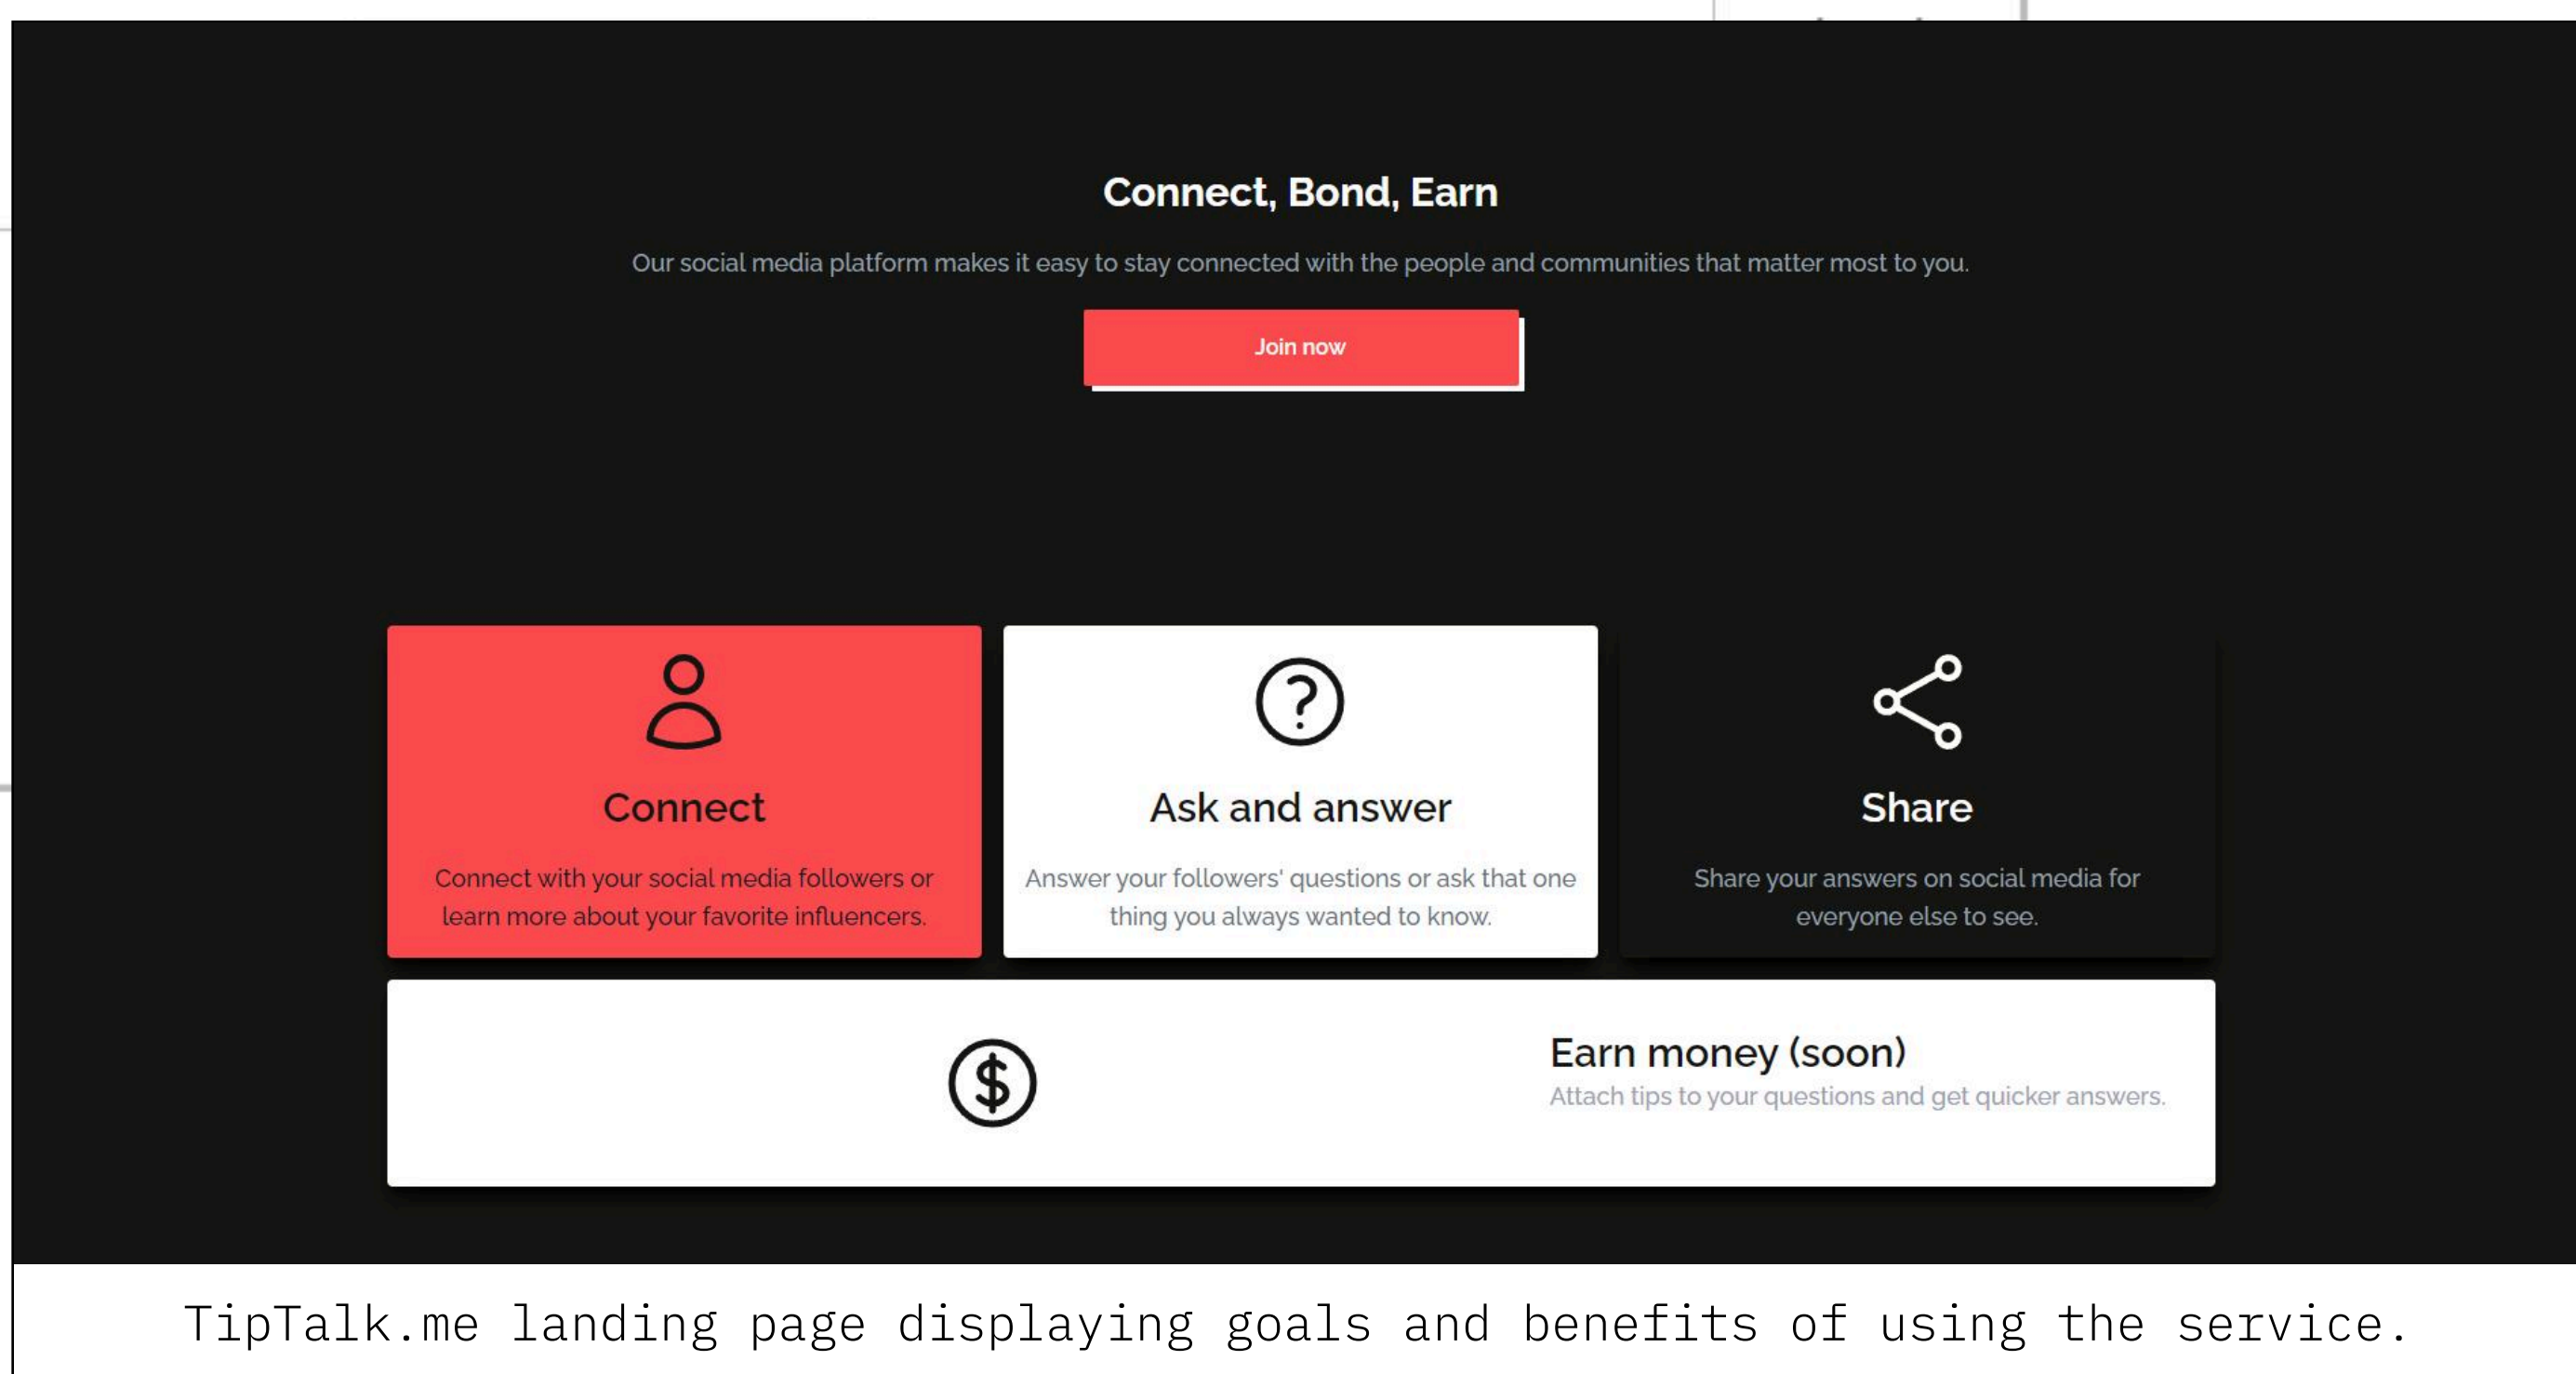

A service for asking and answering questions made by the community while earning money.

TipTalk.me is a platform specifically designed for growing ones' social media community by getting to know your followers and sharing knowledge about yourself.

Future plans for TipTalk.me include adding a payment gateway for allowing fans to tip social media creators for receiving an answer more briefly.

Creators will then be able to cashout all their earnings from within their profile panel.

I used a variation of different technologies for this project.

For the frontend, I used SvelteKit as it provides an easy way of integrating most backend functionality directly within the same repository.

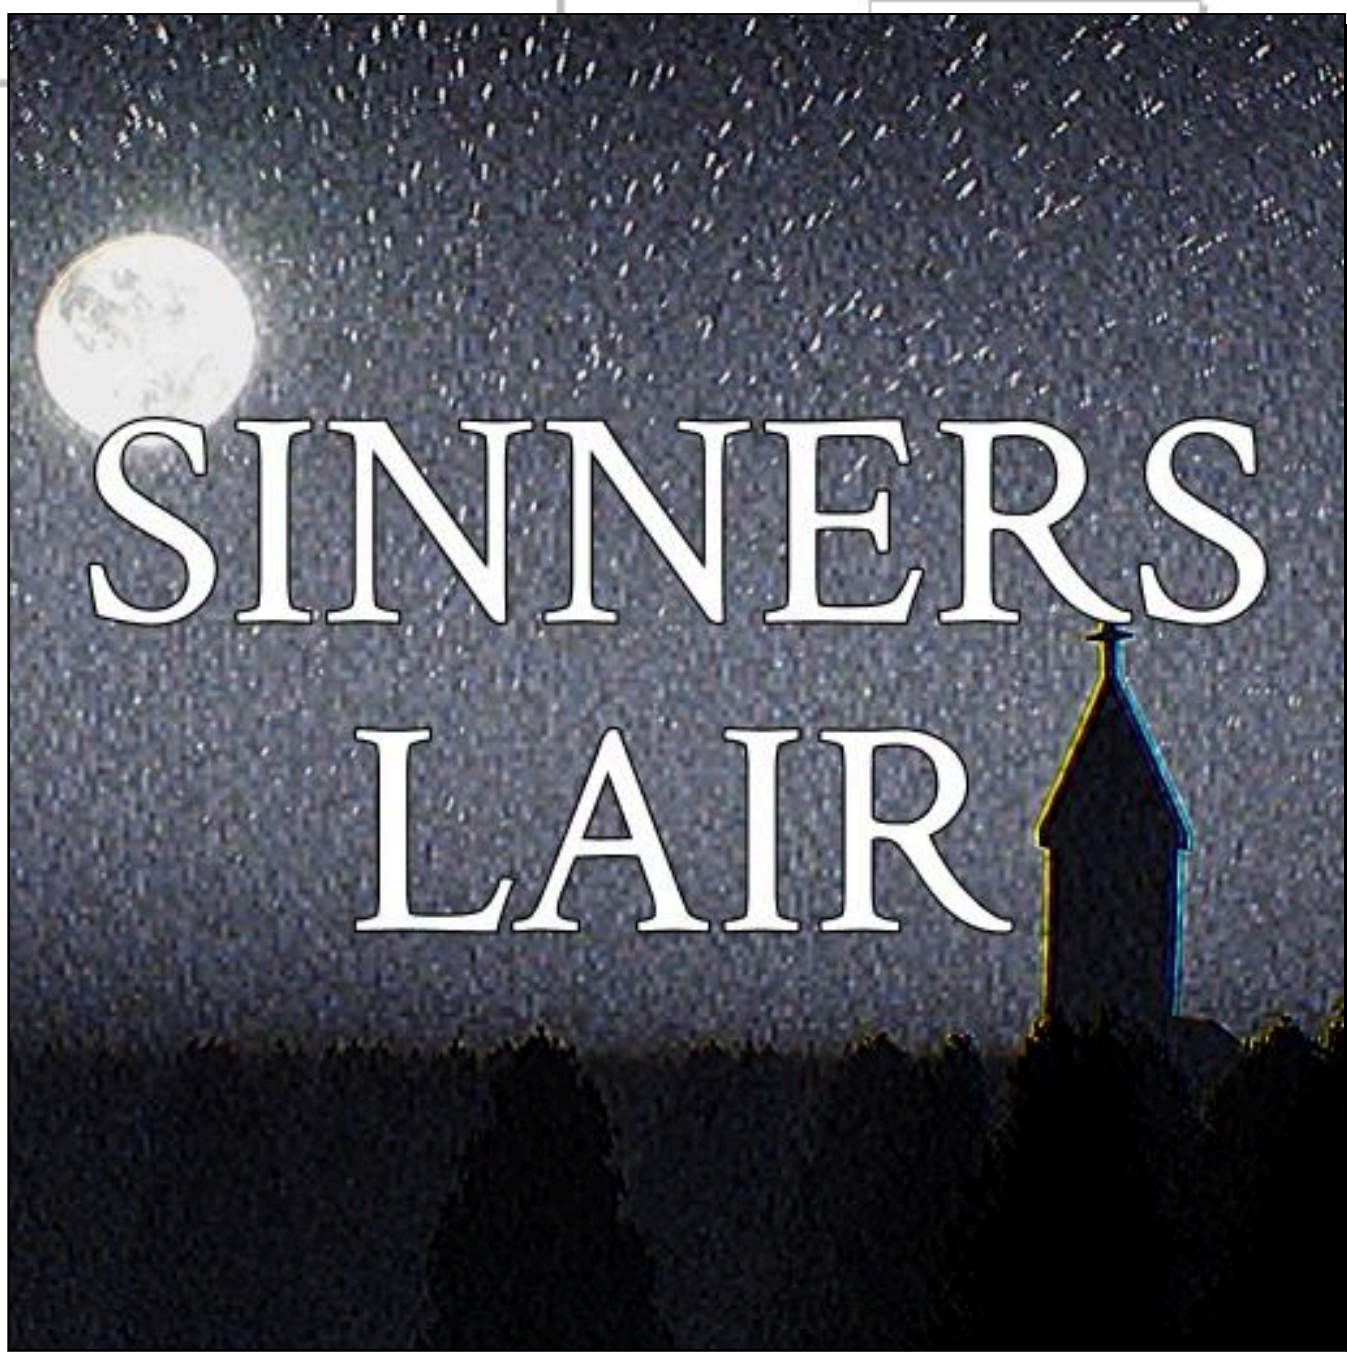

Additionally I added another layer containing Pocketbase for easier authentication implementation and bare necessities to save some time.

Technologies

Sinners' Lair

A horror game developed using the unreal engine.

Sinners' Lair is a game about surviving an epidemic of skinwalkers.

The player has to interrogate people through their door to separate humans from non-humans pretending to be of our kind.

The challenge lies in the need for the player to manually type out their answers quickly enough to gather as much information as possible from interrogation suspects.

I used the Unreal Engine for developing "Sinners' Lair".

In retrospect, most other engines would've been a good fit as well. Since this started out as a university submission which lead to me developing the idea further, I was bound to course regulations which made us use UE 5.4.4.

All sound effects and music were either created or altered by me, using Audacity, to fit the games' theme.

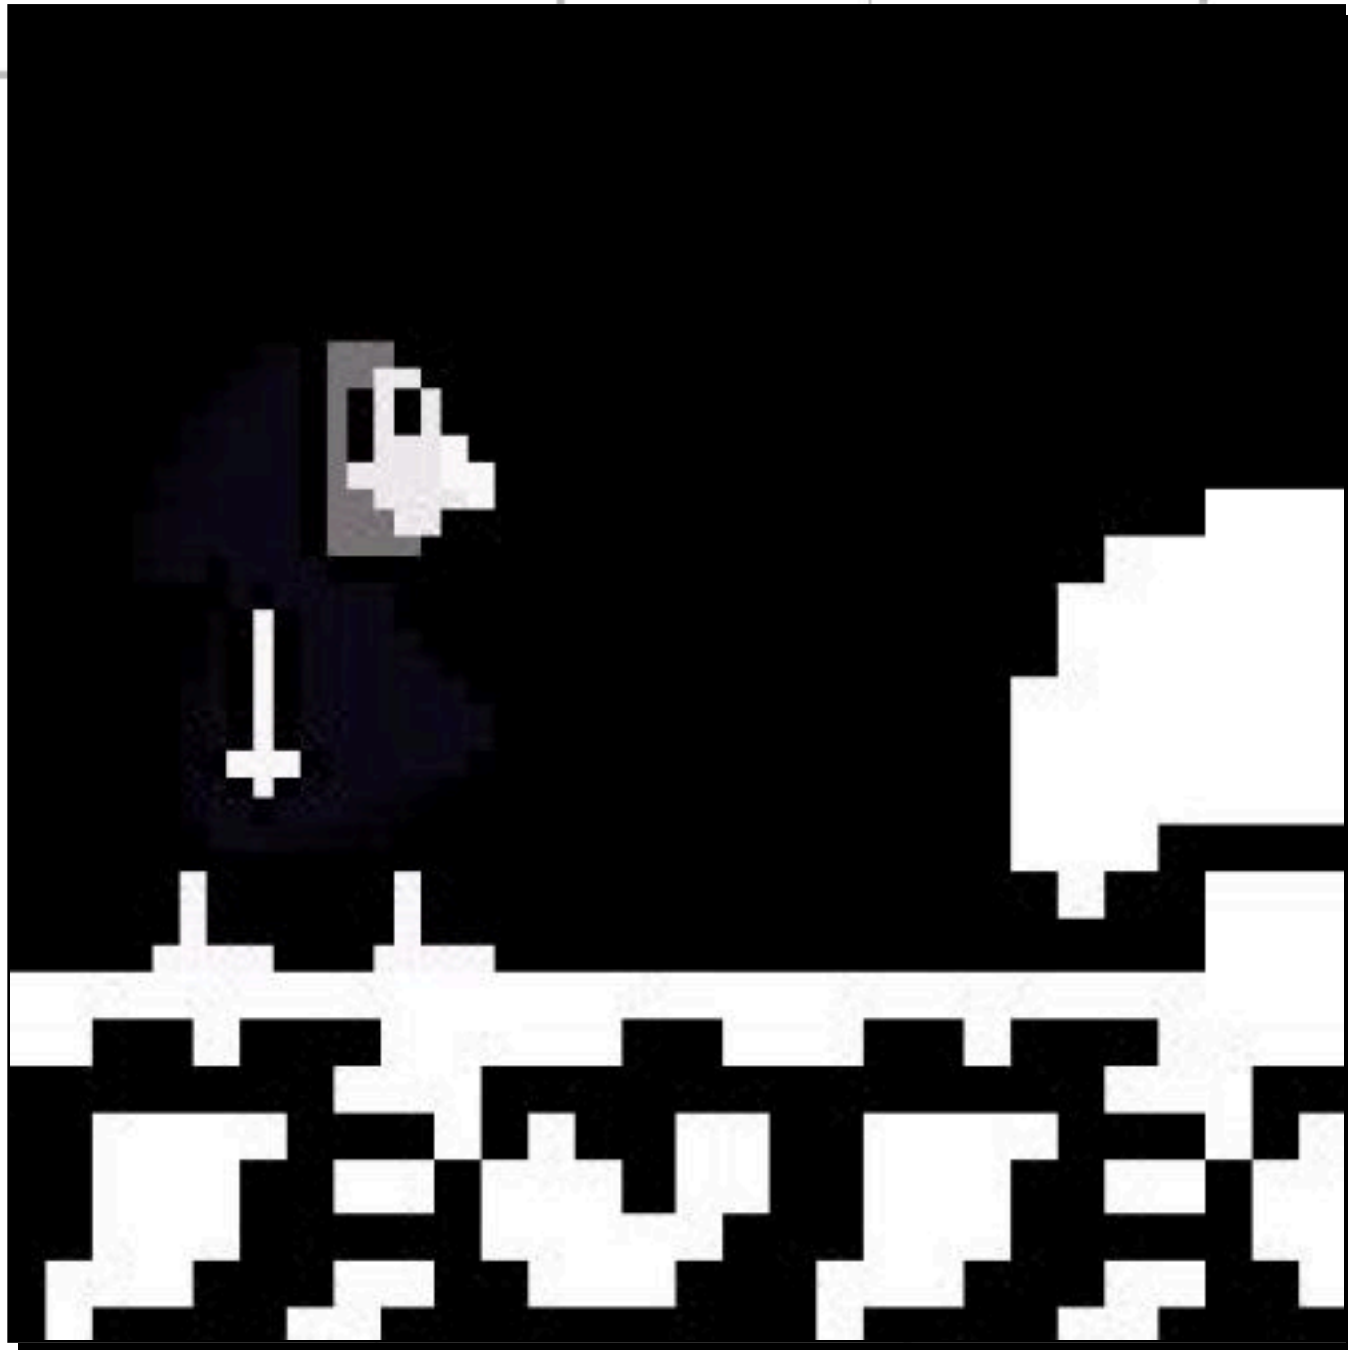

3D assets are mostly from itch.io or self made / altered as well.

Technologies

Degeneracy

My first experiences with game development using the Godot engine.

It was the first Corona Lockdown and I had way too much time on my hands so I decided to dive into game development.

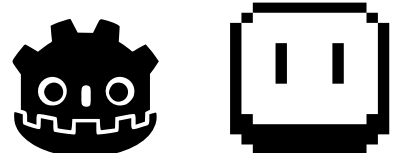

I chose Godot since it allows one to develop and publish games without having to pay any kind of fee or upfront charge.

I used Aseprite for creating my sprites and animations. This took me quite a while since I had no prior experience in terms of animation or 2D art but I wanted to restrict the games' artstyle to 1Bit and 16x16 pixel sprites anyways.

For the technical side of the game, I used the natively in Godot implemented language "GDScript". It is very similar to python with a few differences in terms of error handling, certain keywords and game dev specific enhancements.

Getting into it was relatively easy but getting familiar with certain new programming patterns (e.g. state machines for handling player/enemy movement more effectively) was definitely a challenge at first since game development differs drastically from web development and other fields I had prior experience in.

Technologies

Clockwork Systems

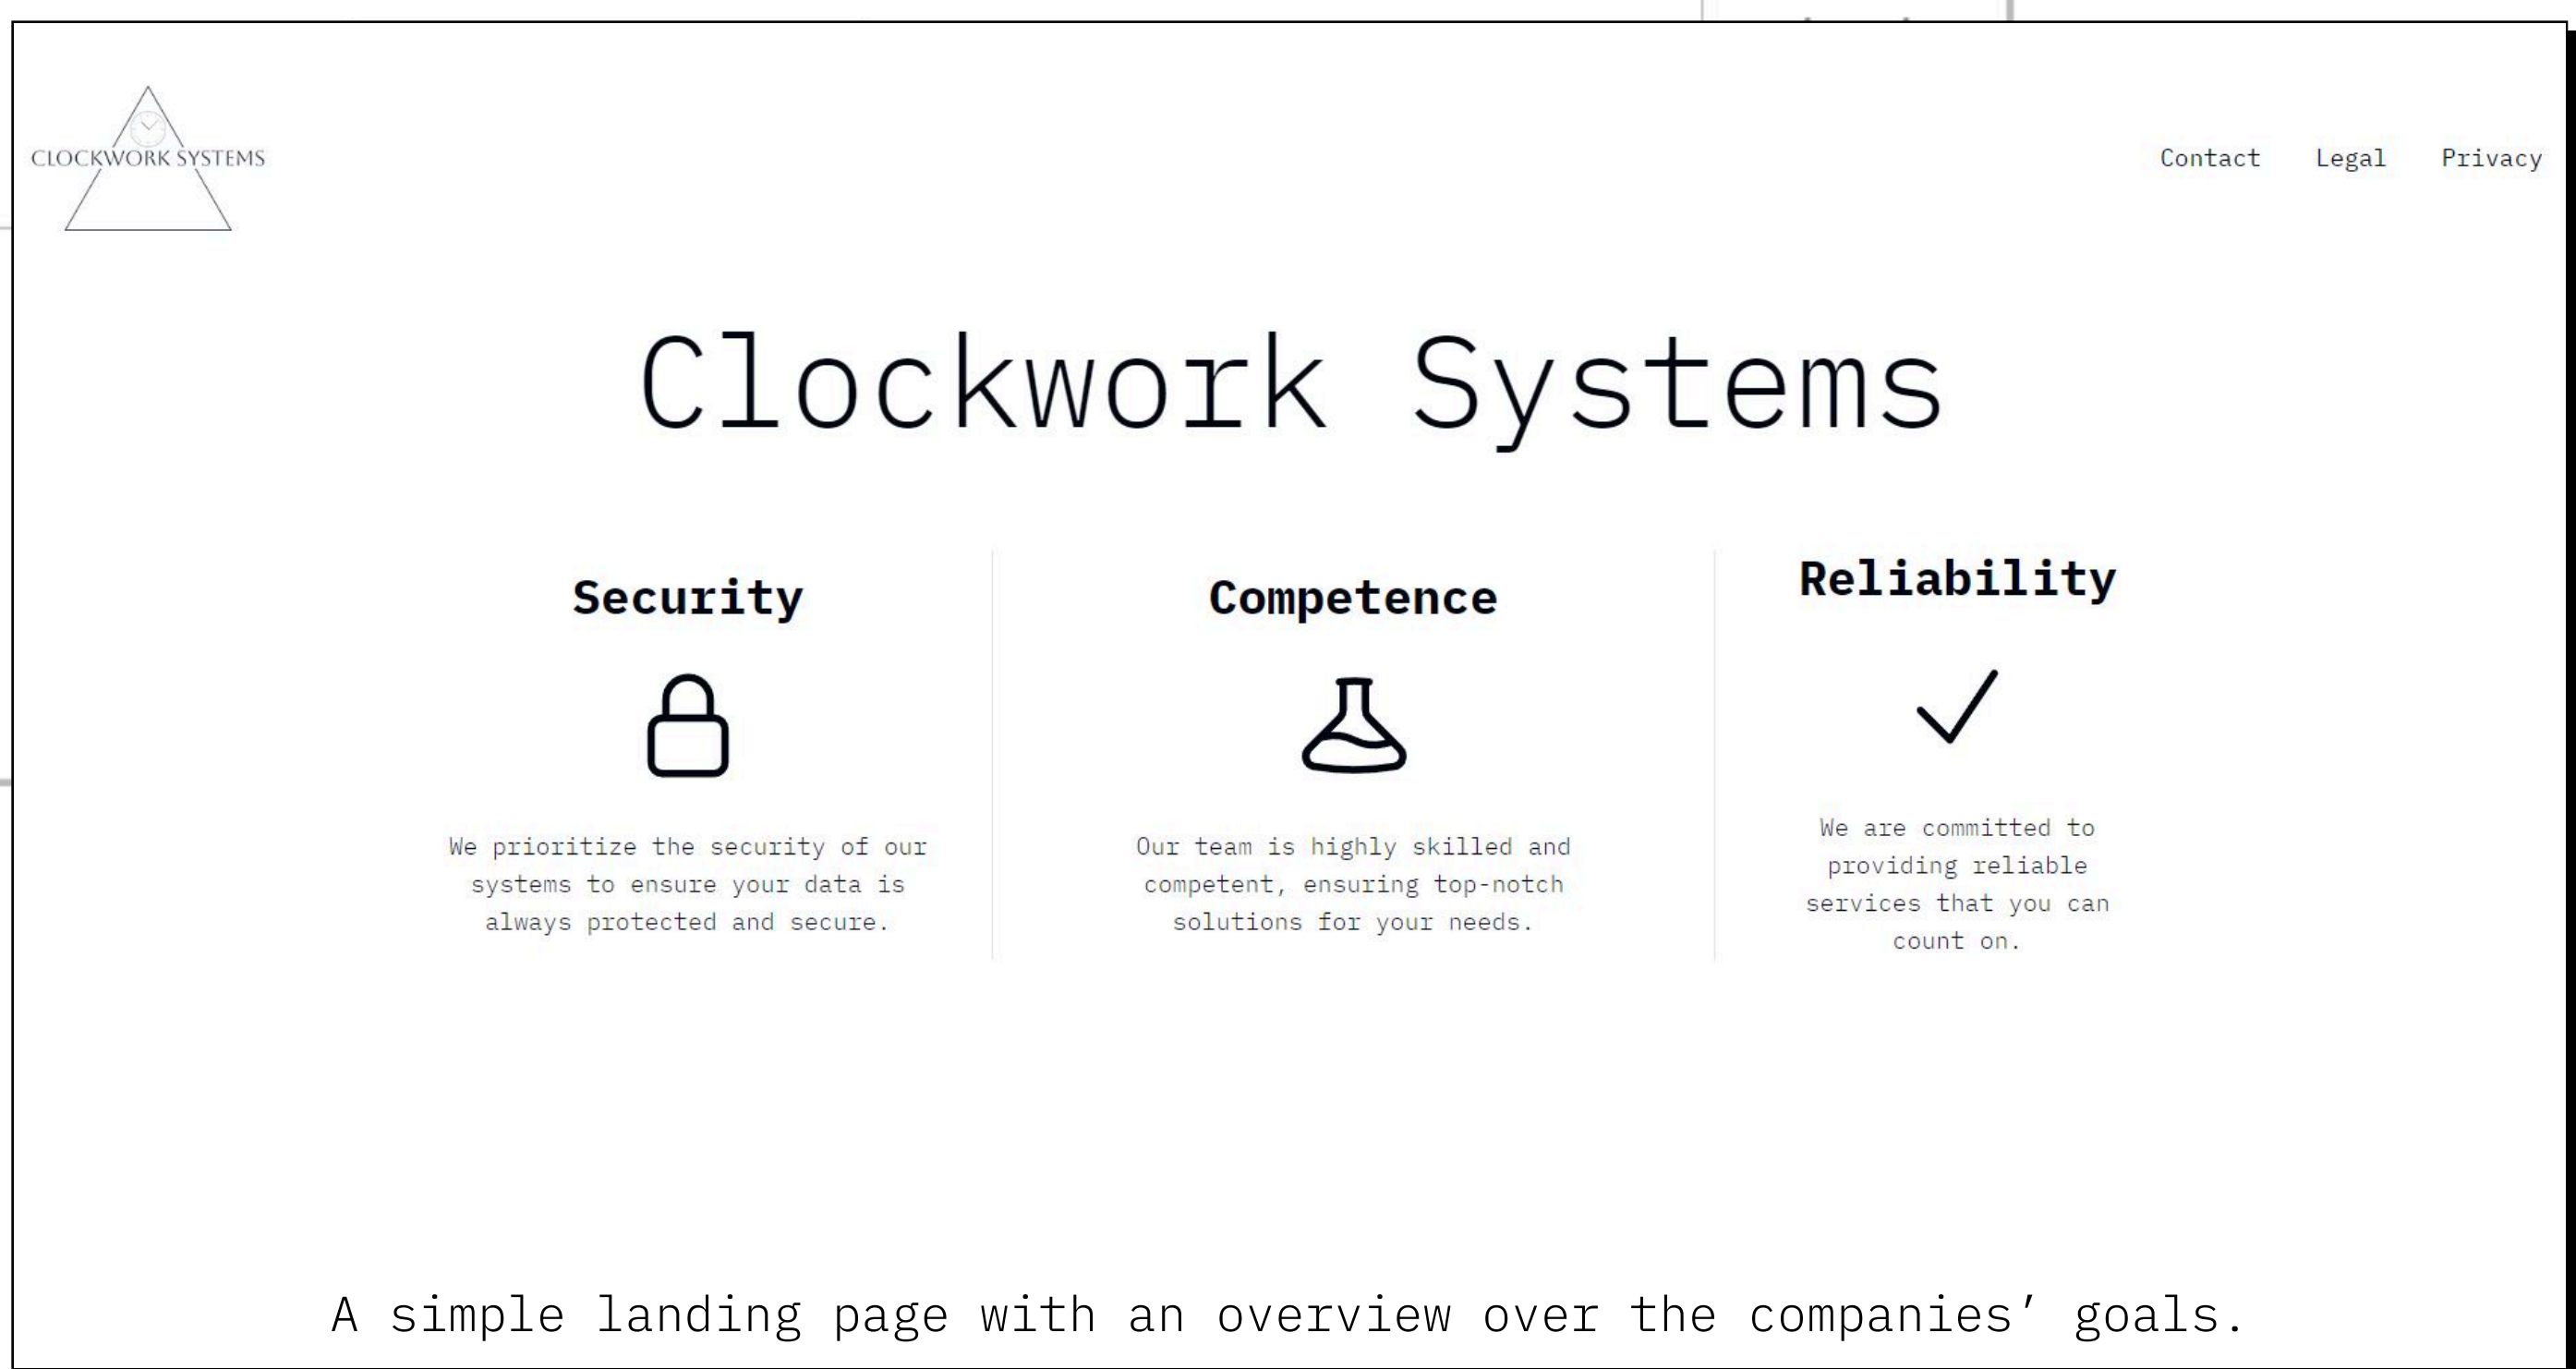

A relatively simple company website for Clockwork Systems UG (haftungsbeschränkt).

We needed a small and simple website for our company.

I decided on using NextJS which I first needed to get familiar with.

It's statically deployed using Nginx and Docker.

I first planned out a base design and decided which font I wanted to use.

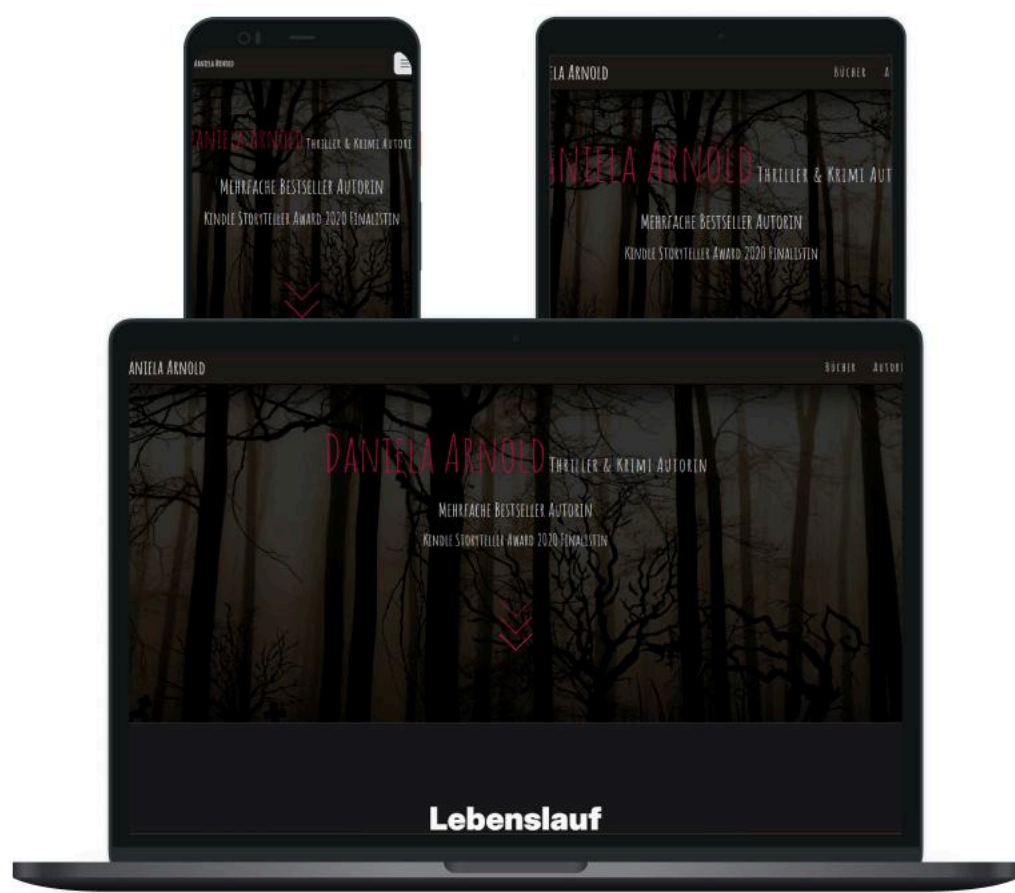

As for my portfolio, I decided I'd use IBM Plex Mono since I believe it's very readable, not too heavy on the eyes when reading long texts and it feels relatively technical.

Technologies

Writer Portfolio

An authors library of published books and an “About me” page.

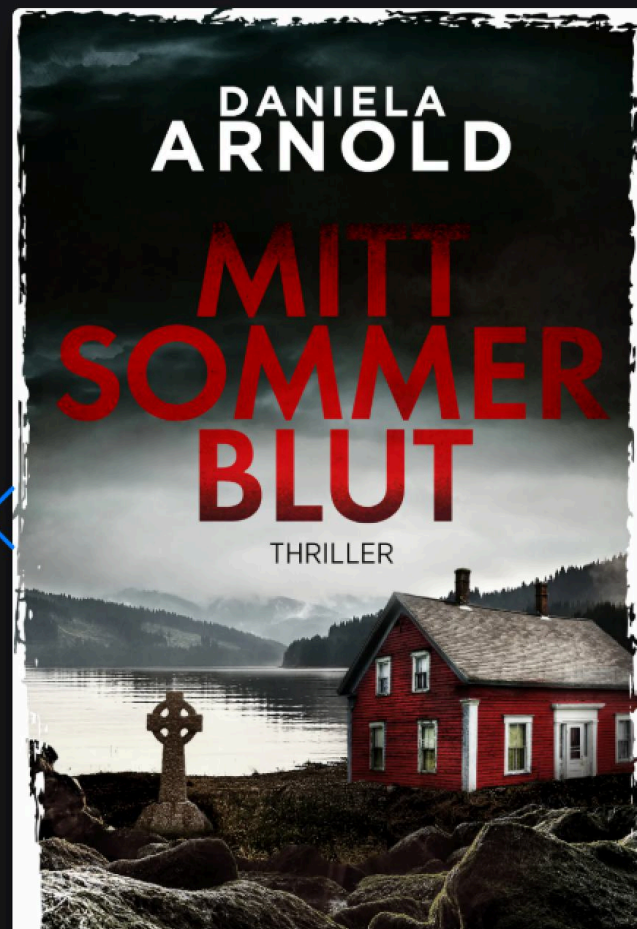

My mother is a professional writer here in germany and needed a portfolio page exhibiting all her works and a small “About me” section.

She had multiple bestseller books so far and the list is growing month by month.

At first I implemented the backend using Django Restframework and managed new books via the default django admin interface.

Later on, I figured it wasn’t worth the hassle of getting Docker to work with Django so I rolled back to a JSON-file based approach and simply used a single JSON file to store all the books in.

Finnland

Mittsommerblut 02.07.2018

“Tot”, stöhnte er und sackte blutüberströmt zusammen. ‘Sie sind alle tot!’
Helsinki:
Ein Wochenende am Bodensee endet für vier junge Leute in einer Katastrophe: Der achtzehnjährige Noel stirbt qualvoll, sein Kumpel wird schwer verletzt und ihre beiden Freundinnen verschwinden spurlos.
Das Team um Polizeihauptkommissarin Janne Göös steht vor einem Rätsel, denn der Fall erinnert an ein grauenvolles Verbrechen aus den 1960er Jahren, das nie aufgeklärt wurde. Handelt es sich um einen Nachahmungstäter?
Kurz darauf verschwinden wieder drei Menschen. Zeitgleich taucht die Leiche eines lang vermissten Mädchens auf, das laut Obduktion erst Jahre nach seiner Entführung starb....

Book overview sorted by country they take place in.

Originally I developed the application using SvelteKit & Django Restframework.

I came to the conclusion a simple JSON file containing all the books should be enough for my needs and rolled back to this simpler approach later on.

The website is GDPR compliant and contains a newsletter signup form too (Mailchimp).

Technologies

Docknote

Docker based implementation of the service "Privnote".

The idea was having a way to setup a way to share private notes that delete on opening them.

By using Docker to setup frontend, backend and the Redis database, everyone can run their own private and secure notes sharing platform using just a single Docker command.

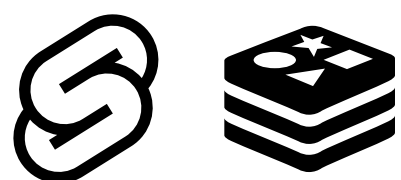

The application can be set up with a single command `"docker compose up -d"`.

Once running it's very ease to create new notes, generate a link and have that note destroy itself after being read.

For the future I contemplated implementing customization options like auto deletion after a certain amount of time if the note has not been read.

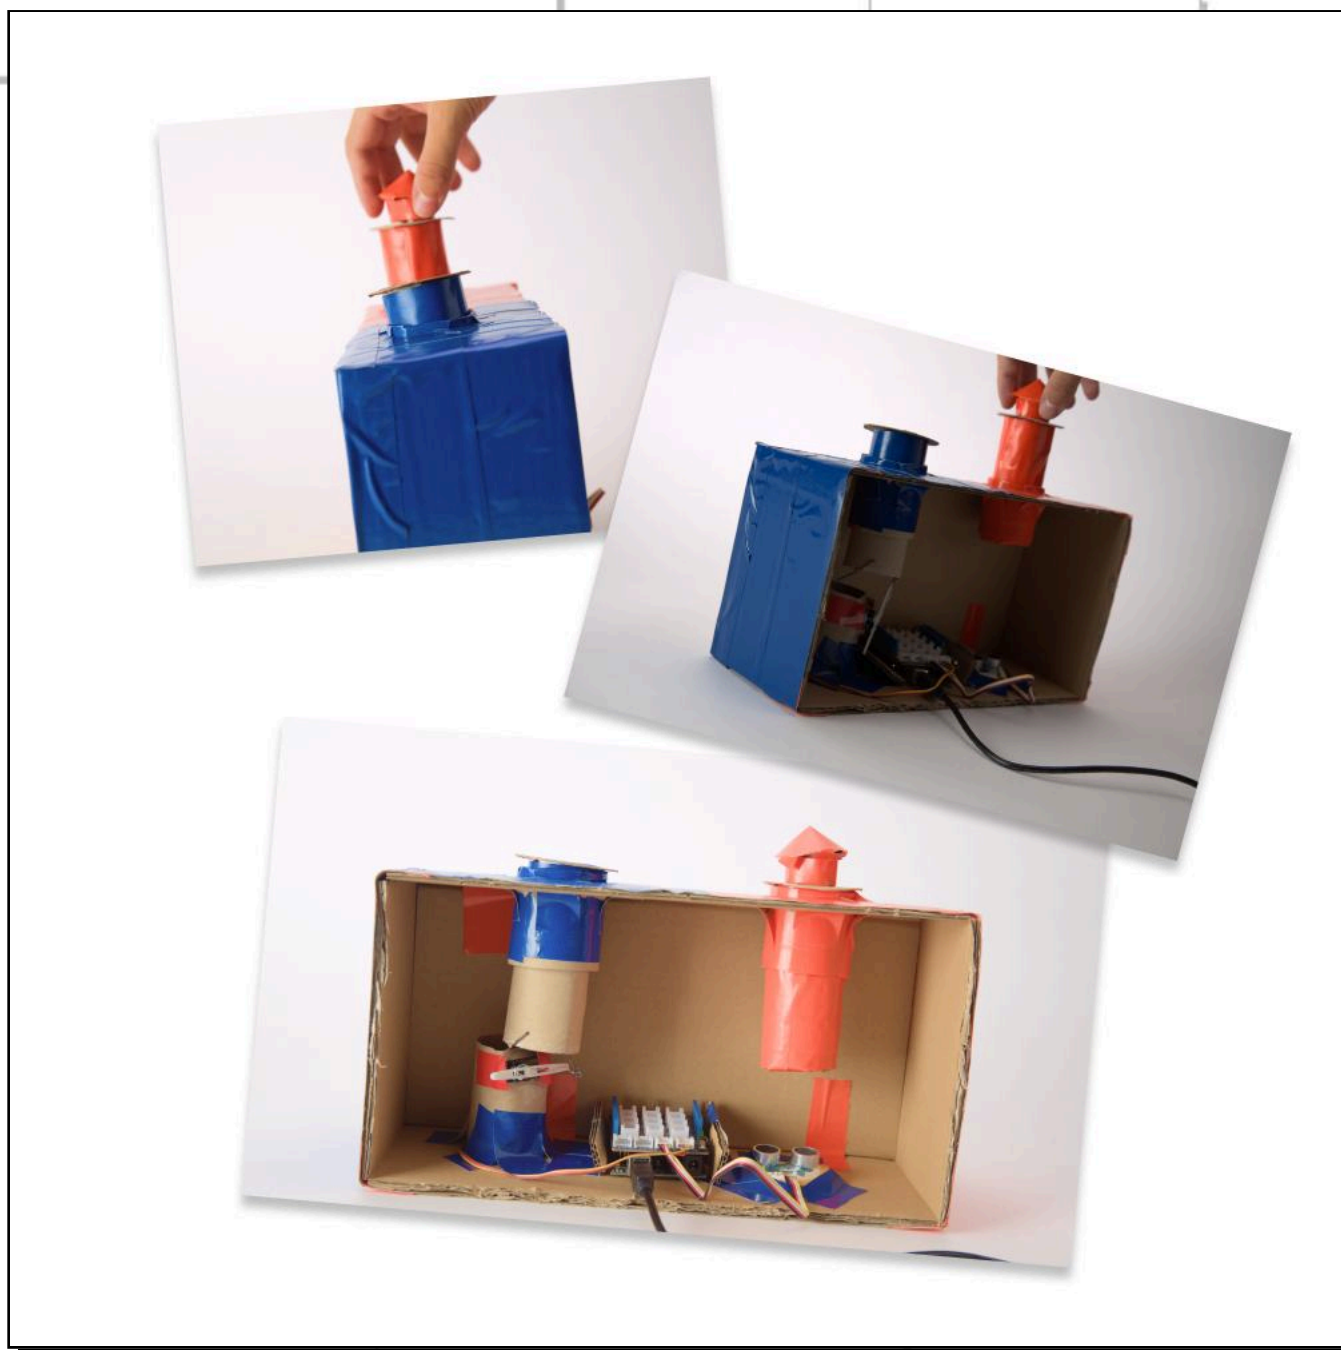

Notes are only being stored inside a "Redis In-Memory-Database" so they are not actually stored on the drive which makes them basically unrecoverable in case of a system breach for maximum anonymity.

Technologies

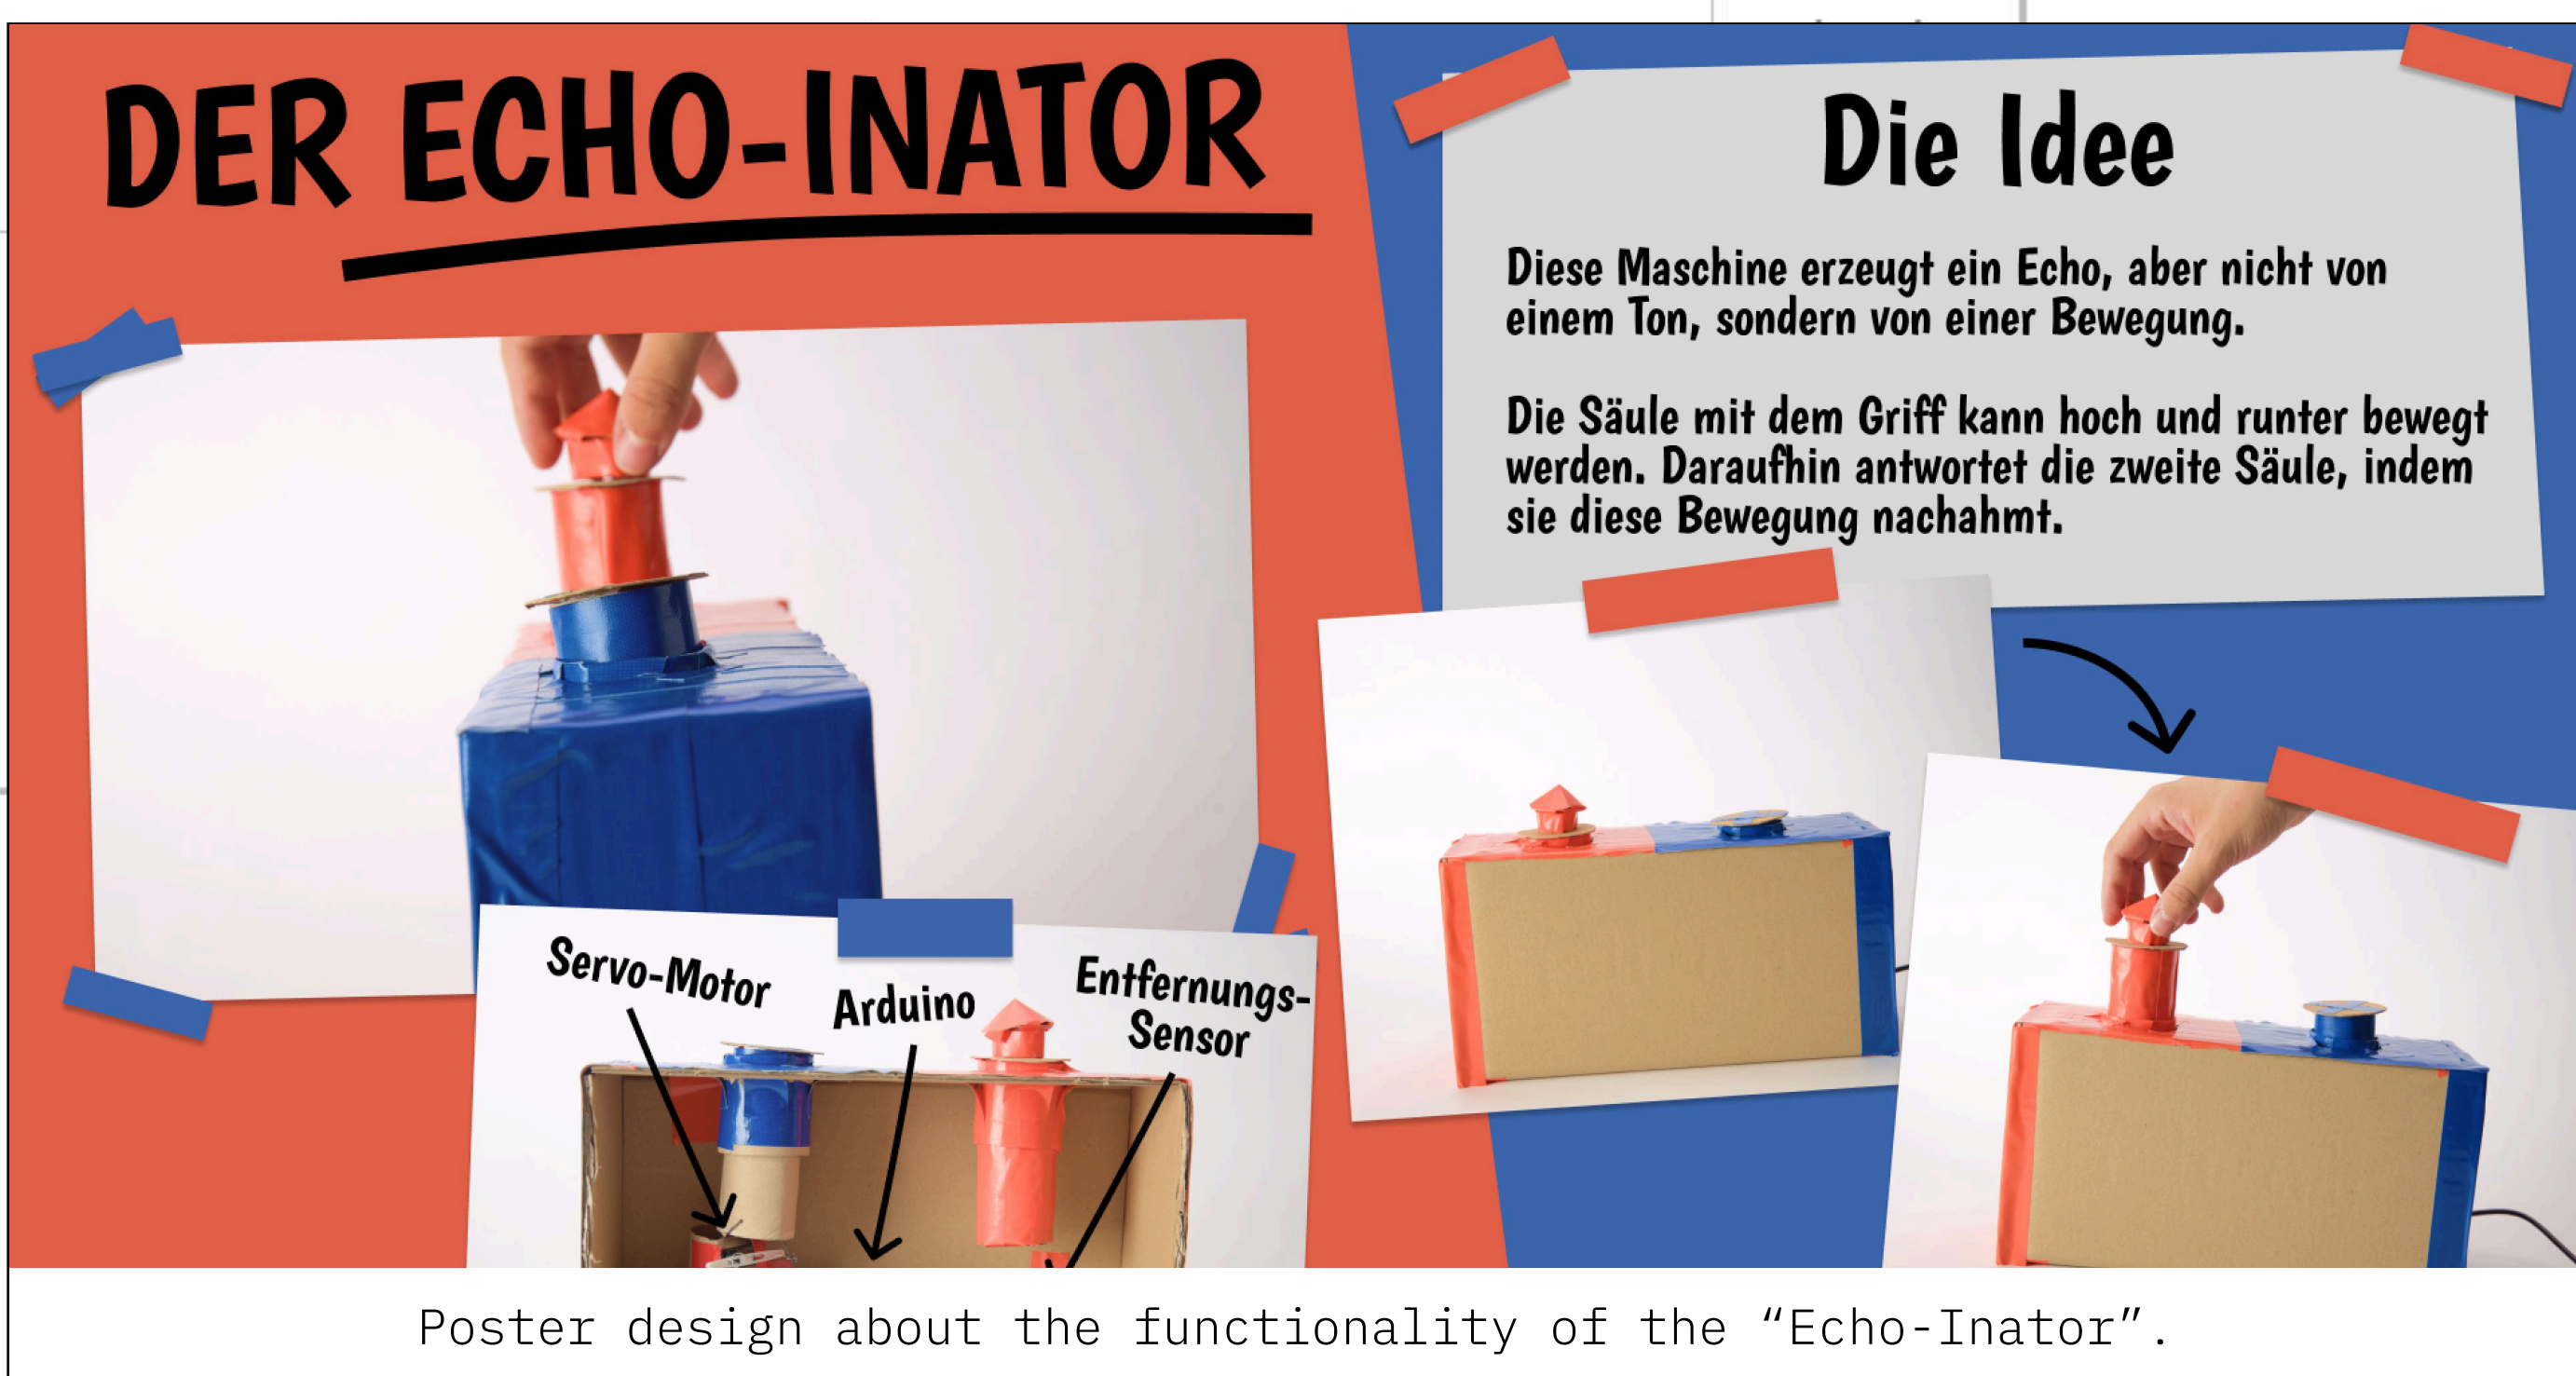

Echo-Inator

A physical interface that mimics human movements.

The idea was a physical interface, using Arduinos, that is capable of recognizing and mimicking movements made by users.

Users move the orange lever upwards or downwards which leads to the blue lever being moved upwards or downwards as well, depending on the users' input.

Poster design about the functionality of the "Echo-Inator".

This project was a group effort by my group partner and me.

My job was writing the necessary Arduino code, building a mechanism for the sensor to detect motion and the servo motors to change the position of the levers and finally creating the first version of our project trailer.

His job was building a box prototype, creating the final trailer for our submission and designing the introduction poster.

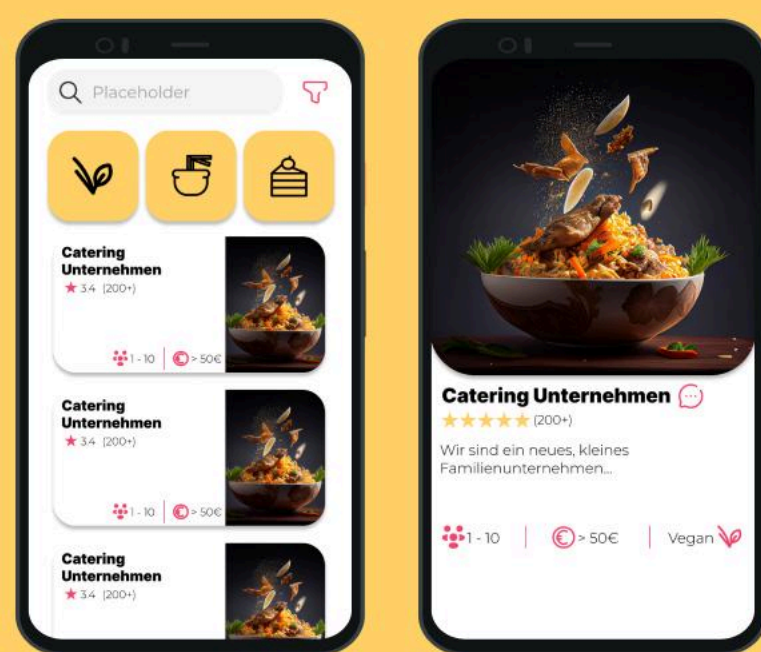

Finally, both of us built the final box together and presented our work.

Technologies

Cookster

Figma designs for a mobile catering platform.

At first my goal was mainly getting more experience with mobile app design and development technology.

I planned out the first few interfaces using Figma and put them into action with Flutter.

After getting familiar with Pocketbase, I implemented basic authentication, a profile page as well as fundamental database presets for later use.

Cookster is supposed to function as a “Catering as a service” application with users signing up for free while caterers have to pay a monthly fee depending on their plan.

The main reason for choosing Pocketbase as a backend was primarily to be able to create a working prototype as fast as possible.

Technologies

Smart Napf

A smart home mobile application for controlling pet food bowls. (Design only)

My goal was designing a mobile application that had something to do with smart homes generally.

After contemplating a few ideas, I chose an app that would let pet owners control their smart bowl for automated feedings, analysing pet feeding behaviour, etc.

I also used the "Smart Napf" to get more familiar with designing and prototyping using Figma.

Smart Napf - Erläuterung

Our valuable Smart Napf provides our customers with the capability to ensure that their beloved pets are always well fed.

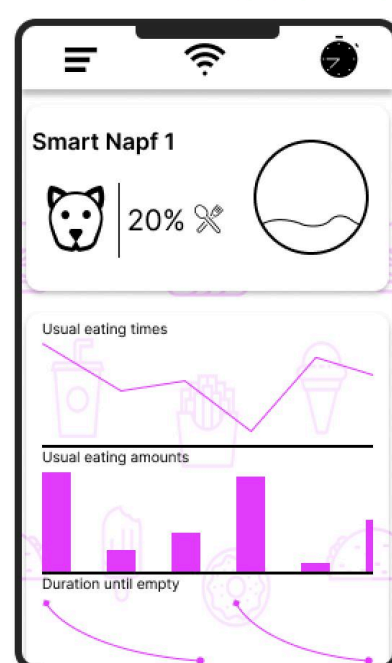

Either set intervals or feed your little companions manually.

Bowl's empty? Don't worry, we'll let you know!

Furthermore, you can also track your pets' behaviour while feeding to see if something's wrong.

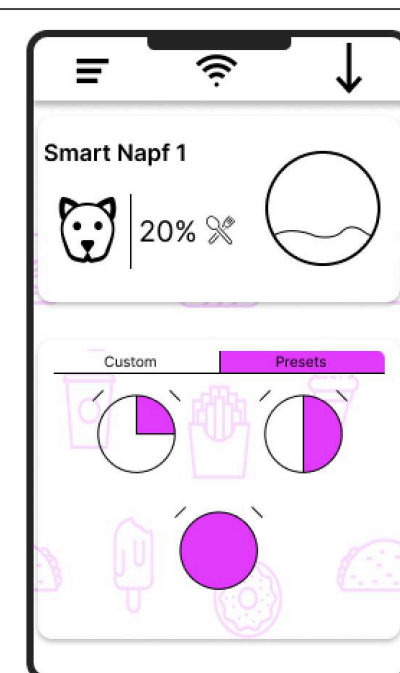

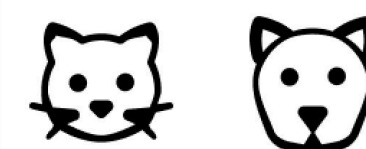

Not just a food bowl

The Smart Napf can also track your pets' feeding behaviour and recognize unusual or even concerning patterns.

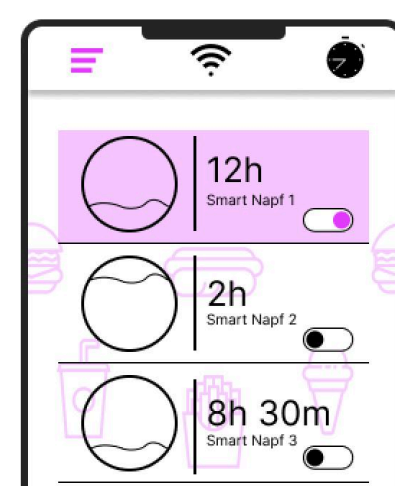

Intuitive Icons

Our interface, including our icons Icons are made with the best user experience in mind.

Support for multiple pets

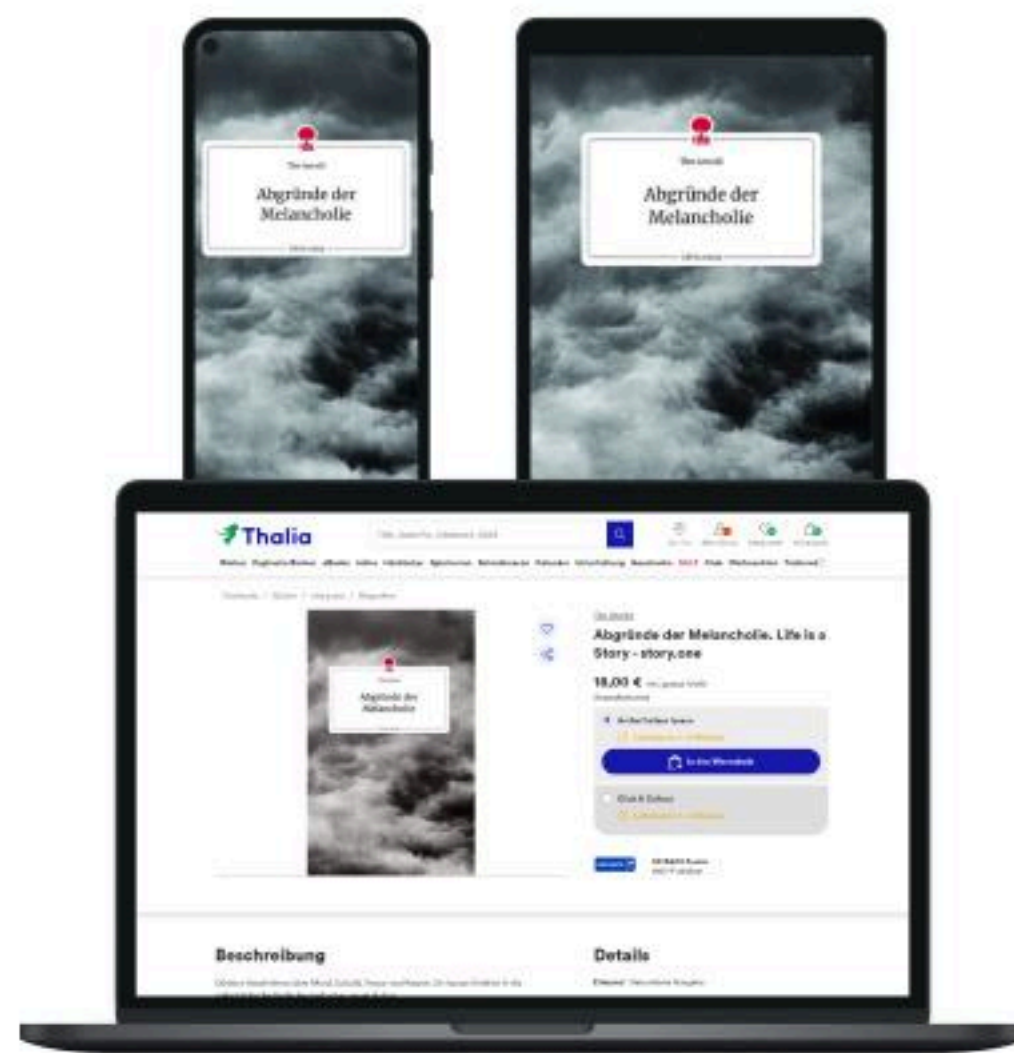

Owning multiple cats and dogs? With the Smart Napf, you can manage multiple pets at once with ease.

Poster design for the rough "Smart Napf" design.

Book

A collection of dark short stories written by me, combined within a book.

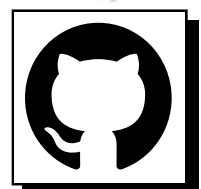

For the 2022 Young Storyteller awards, I wrote a collection of short stories on the website "story.one".

Story.one is a website specifically designed for writing and publishing short stories with a max amount of 2500 characters.

"Abgründe der Melancholie" consists of a few selected stories of mine. It contains around 70 pages and 14 stories in total.

It's also possible to read my stories (including those from the book) on my public story.one profile.
